MindMatch — Showcase Cheat Sheet

🎯 MindMatch — Showcase Cheat Sheet (28 Apr 2026)

> **Print this. Glance, don't read aloud. The booth is conversational, not a pitch.**

🔥 30-SECOND OPENER (memorize verbatim)

> "MindMatch solves the #1 problem in starting therapy: **fit anxiety**. We match patients to psychologists on the dimensions APA's Task Force on Evidence-Based Therapy Relationships classifies as Demonstrably Effective — **your preferences, how you want to be helped, culture, and goal alignment** — and we **de-risk the choice with swap protection**: if it's not the right fit in the first 3 sessions, the patient transfers their unused package to another therapist at no extra cost. We're starting in Lisbon."

Why this works: preempts the #1 reviewer note (your differentiator got lost last time). Leads with the *problem*, not the tech.

🧠 IF ASKED "What's your matching framework?" (Anne-Laure WILL ask)

> "We match on the dimensions that have the strongest empirical evidence in psychotherapy research — specifically the four matching variables the **APA Task Force on Evidence-Based Therapy Relationships** (Divisions 12 + 29, Norcross & Wampold) classifies as **'Demonstrably Effective'**: **patient preferences, reactance level, culture, and religion/spirituality.**
>
> Operationally, three layers:
>
> 1. **Structured filters** — therapy approach, language, gender, location, price (covers preferences + culture).
> 2. **A guided 5-question conversational intake** that surfaces what brought the person to therapy, prior experience, communication preference, and how directive vs collaborative they want the therapist (covers reactance + goal consensus).
> 3. **Verified post-session feedback** — patients rate therapists on the qualities the evidence says heal: empathy, warmth, goal collaboration. The Task Force classifies collecting client feedback as Demonstrably Effective. **Swap protection** is the behavioral safety net: if it's not the right fit in 3 sessions, the package transfers free.
>
> So we surface therapists who fit *your* preferences AND who consistently embody the relational qualities the evidence shows actually drive outcomes — empathy, warmth, and goal alignment."

Killer move: "APA Task Force" + "Demonstrably Effective" is the strongest possible scientific language. Lead with what you DO — don't waste oxygen on what you don't do.

🔬 EVIDENCE BASE (memorize the bold numbers)

From **Laska, Gurman & Wampold (2014)**, *Psychotherapy* 51(4), Table 1 — % of outcome variance explained by each factor:

Factor	% variance	Source
Goal consensus / collaboration	**11.5%**	Tryon & Winograd 2011 meta-analysis
Empathy	**9.0%**	Elliott et al. 2011 meta-analysis
Therapeutic alliance	**7.5%**	Horvath et al. 2011 / Flückiger 2018
Positive regard	7.3%	Farber & Doolin 2011
Congruence / genuineness	5.7%	Kolden et al. 2011
Therapist differences	5.0%	Baldwin & Imel 2013
Specific treatment technique	**<1.0%**	Wampold & Imel 2015

Combined common-relationship factors ≈ 30% of variance. Specific treatment technique < 1%. Patient/extratherapeutic factors estimated ~40% (Lambert 1992).

APA Div 12/29 Task Force official conclusion (verbatim, quotable):

> "The therapy relationship makes substantial and consistent contributions to psychotherapy outcome independent of the specific type of treatment. The therapy relationship accounts for why clients improve (or fail to improve) **at least as much as the particular treatment method.**"

Matching dimensions classified "Demonstrably Effective": Patient Preferences, Reactance/Resistance Level, Culture, Religion/Spirituality.

Matching dimensions classified "Probably Effective": Stages of Change, Coping Style.

Citations to drop (in order of impressiveness)

1. **Norcross & Lambert (eds.) 2018 — *Psychotherapy Relationships That Work* (3rd ed., Oxford UP, 2 vols)** — the field's evidence-based bible.
2. **Norcross & Wampold (2018)** — "A new therapy for each patient" — *J. Clin. Psychology* 74(11):1889–1906. Task Force summary.
3. **Flückiger, Del Re, Wampold & Horvath (2018)** — alliance meta-analysis, *Psychotherapy* 55(4):316–340. r ≈ .278, n > 30,000 patients across 295 studies.
4. **Wampold (2015)** — "How important are the common factors in psychotherapy? An update" — *World Psychiatry* 14(3):270–277. Open access.
5. **Baldwin, Wampold & Imel (2007)** — *J. Consult. Clin. Psychology* 75(6):842–852. Showed alliance-outcome link is driven by **therapist** variability, not patient → some therapists are reliably better → finding them is the product.
6. **Bordin (1979)** — original Goals/Tasks/Bond paper.

🛡️ REVIEWER FEEDBACK — REBUTTALS READY

Their concern (from emails)	Your answer
"Is it really *personality* fit that	"You're right — it's not. The APA Task Force on Evidence-Based Therapy Relationships classifies four matching dimensions as **Demonstrably Effective**: patient preferences,

Their concern (from emails)	Your answer
matters?”	reactance, culture, and religion/spirituality. Personality similarity isn’t on the list. We match on what the evidence supports.”
“Maybe therapy STYLE matters more”	“Agreed — and the meta-analytic data backs that: **goal consensus alone explains 11.5% of outcome variance — more than the alliance itself (7.5%).** That’s why therapy approach is a primary filter, not a soft signal. Specific technique only explains <1%, so we don’t push CBT-vs-psychodynamic — we push goal alignment.”
“Do users understand their options?”	“Yes — every practitioner profile explains their approach in plain language, and the AI intake explicitly asks about preferred communication style. We’re considering a ‘Therapy Approaches 101’ page in v2.”
“What about trust? Testimonials?”	“Verified post-session reviews are core. Patients can leave anonymous 1-5 star + comment. Only verified bookings count — no review-bombing possible.”
“Therapist-patient relationship is peculiar — different from work or personal”	“Exactly. That’s why we anchor on the only field-validated framework for it — the APA Task Force on Evidence-Based Therapy Relationships, plus Bordin’s working alliance (goals, tasks, bond). 50 years of meta-analytic support, n>30,000 patients in the latest alliance meta-analysis (Flückiger 2018).”
“Have you tested with real patients AND therapists?”	“We’ve done informal interviews with [X] friends who’ve been in therapy. Next step is the survey Anne-Laure suggested — partnering with NovaSBE Wellbeing team to reach more patients, and OPP-listed psychologists for supply side.”
“How will you measure match success?”	“Three proxies: **swap rate in first 3 sessions** (lower = better fit), **completion rate of the package**, and **post-package NPS**. Long-term, we want to track 6-month retention as the gold-standard proxy.”

🎬 DEMO FLOW (3 minutes — practiced)

You have **1 table + your laptop** (no computer provided by venue). Open the prototype in **Chrome mobile view (iPhone 14 Pro)** for the wow factor.

```
http://localhost:8080
```

1. **Onboarding** → “This is what a new user sees on their phone”
2. **Find a Psychologist** → **Sign up sheet** → “Standard Google OAuth, 2 seconds”
3. **Home** → “Personalized greeting, the AI Match banner is the premium hook”
4. **Tap AI Deep Match** → walk through the 5 questions → “This is the €9.99 premium feature — 95% margin”
5. **Match Results** → “Top 3 with compatibility %. The match is built on what APA classifies as Demonstrably Effective — preferences, reactance, culture, goal alignment.”
6. **Open profile** → “Bio, approach, languages, price — full transparency”
7. **Book Session** → **Standard package** → “Three tiers, swap protection on all of them”
8. **Checkout** → **Success** → **Bookings tab** → “Done. 7 taps from sign-up to confirmed booking.”

If they ask for more: Search tab (56 practitioners filterable) → Practitioner onboarding form.

📊 STATS TO DROP CASUALLY

- 13 interactive screens
- 56 practitioner profiles, 20+ Lisbon neighborhoods

- 3,200+ lines of code in the prototype
- Break-even at **2 bookings/month**
- 95% margin on AI matching
- Under €70/month infrastructure cost
- Session packages reduce no-shows by up to 40%

🚧 HONEST ANSWERS (don't bullshit — they'll smell it)

Q	Honest answer
"Is the backend built?"	"No — this is the interactive prototype. We deliberately validated UX first. Stack is chosen (Next.js + Supabase + Stripe + OpenAI). 4-6 weeks to functional MVP."
"How many real psychologists onboarded?"	"Zero in the platform yet — the 6 featured profiles are based on real anonymized OPP profiles, the other 50 are realistic synthetic data so we could test browse/search at scale."
"Have you talked to therapists?"	If true → say what you've learned. If not → "Not formally yet — that's the immediate next step, partnering with the NovaSBE Wellbeing team and reaching out via OPP." (don't invent interviews)
"What's your moat?"	"Three things: swap protection (no one else offers it in PT), AI matching grounded in working-alliance theory, and Lisbon-first density — quality over coverage."
"Why not just a directory?"	"Directories solve discovery. We solve **commitment friction** — the fear of choosing wrong. That's a different problem."
"Why packages instead of pay-per-session?"	"Two reasons: (1) reduces no-shows by 40% — patients are committed, (2) lets us offer swap protection economically — we're protecting a known revenue pool."

💼 THE TEAM SLIDE (in case asked)

- **Tomás Maria Burnay Batalha** — Co-founder, GTM & product
- **Marta Drummond Botelho** — Co-founder
- Backed by: ERA Chair Prototyping Fund (€300, NovaSBE), advised by Prof. Anne-Laure Fayard

---

⚠️ DON'T FORGET

- [ ] Bring laptop + charger (no computer provided)
- [ ] Open `http://localhost:8080` in Chrome **mobile view** (iPhone 14 Pro)
- [ ] Have a **business card / QR code** ready — people will ask
- [ ] If WiFi is shaky: prototype is fully offline (PWA + service worker) ✅
- [ ] Phone fully charged (in case you want to demo it as installed PWA)

🧊 ICE-BREAKERS for visitors at the booth

- "Have you ever tried therapy or thought about it?" → opens 80% of conversations
- "What's the biggest reason people don't start therapy?" → they'll guess fit/cost — you say "fit. We solve fit."

- “Want to see the AI matching in 30 seconds?” → leads them to the demo

---

Last words before you leave: BREATHE. The work is done. You have a great prototype, a clear thesis, and a story that addresses every reviewer concern. Just be a human at a table.
